

Yes? No? Go! — One-Page App Summary

What it is

Yes? No? Go! is a SwiftUI iOS decision helper that generates random outcomes (coin flip, yes/no, custom options, rock-paper-scissors, and an orb mode). It layers audio, haptics, and animated UI to make quick decisions feel playful.

Who it's for

People who want a fast, fun way to make low-stakes decisions on iPhone or iPad.

What it does

- Five decision modes: Coin Flip, Yes/No, Custom choices, Rock-Paper-Scissors, and Orb.
- Animated gradient UI with glass-style cards and mode-specific theming.
- Haptic feedback and sound effects for selections and results.
- Siri/App Shortcuts via App Intents for coin, yes/no, custom, and RPS outcomes.
- Home screen widget with deep links to jump into modes.
- Tip Jar using StoreKit consumable purchases to support development.

How it works

- SwiftUI entry point YesNoGoApp loads ContentView, which owns UI state and random decision logic.
- Quick actions and deep links set QuickActionManager.pendingQuickAction; ContentView consumes it and triggers the selected mode.
- App Intents (FlipCoinIntent, YesNoDecisionIntent, CustomChoiceIntent, RPSIntent) provide Shortcuts responses without opening the app.
- WidgetKit extension (YesNoGoWidget) renders small/medium widgets and links to app deep-link routes.
- TipJarManager uses StoreKit to load products and complete consumable purchases; TipJarView presents the UI.

How to run

- Setup/build documentation: Not found in repo.
- Open the Xcode project at Yes? No? Go!.xcodeproj.
- Select the Yes? No? Go! app target and an iOS simulator/device, then Run (Cmd+R).
